

How To Configure A WordPress Domain For Westhost

In order to configure your domain to work with your new WestHost WordPress hosting, you will need to login to your registrar's control panel and to change the nameservers to:

dns1.westhost.com

dns2.westhost.com

dns3.westhost.com

If you need an SSL certificate, you can order an SSL certificate through your CHI control panel. The steps for this can be found [here](#).
