

How To Configure WordPress CloudFlare

CloudFlare is a content delivery system that can significantly reduce the load times on your website. All premium WordPress hosting accounts include this feature. To configure CloudFlare, follow the steps in this article.

- [Step 1: Navigate to the WordPress section of CHI](#)
- [Step 2: Enable CloudFlare](#)
- [Step 3: Configure CloudFlare Settings](#)

Step 1: Navigate to the WordPress section of CHI

To configure your free CloudFlare account through WestHost, you will need to log into your CHI control panel.

Click the WordPress icon as seen below.

Click your domain in the top left hand corner of your screen.

Step 2: Enable CloudFlare

Then click the "CloudFlare" tab at the top of your screen.

In the CloudFlare section you will need to enable the service in order to use it.

Step 3: Configure CloudFlare Settings

Once the service is active, you will have many different settings to turn on or off, depending on how you want the service to function.

If you have questions about any of the settings you can click the question mark tab to contact our technical support team.
