

How To Use PERL Customization In cPanel

This article is for cPanel Accounts. Determine where your account is with [this guide](#).

On the shared cPanel servers, Perl modules are only available as is. There is no access to compile and the cPanel "Perl Modules" icon is not available. If the website requires additional or changes to the Perl Modules, the account will need to be upgraded to Cloud Hosting, Cloud Reseller Hosting or a Dedicated Server[preferable unmanaged].

You can check what Perl Modules are currently available by running the shell command

```
instmodsh
```

and hitting `l` to list the modules.
