

# What Perl Modules Are Installed By Default

*This article is for cPanel Accounts. Determine where your account is with [this guide](#).*

Log into cPanel and on the main page select "Perl Modules." This will generate a list of the currently installed modules that you can review. There are tools on this page that you can use to install other Perl modules you may need.

Modules are installed directly from the CPAN repository.

The installation of custom applications, tools, modules, and software is your responsibility. WestHost Support may not be able to assist you with any issues you have installing Perl modules. Please contact Support if you have questions about using the Perl module tools.
